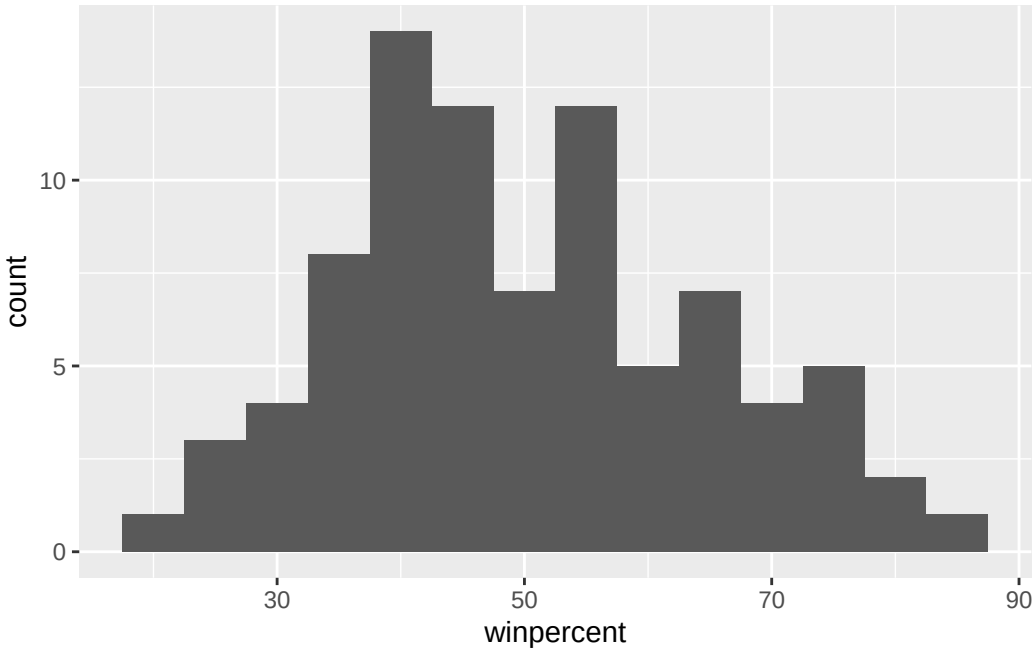
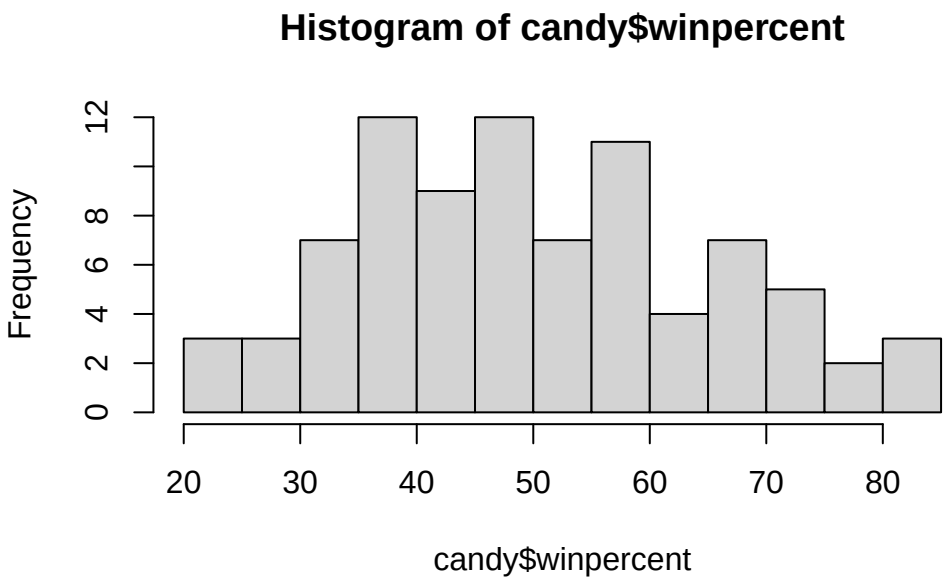
Q6. Is there any variable/column that looks to be on a different scale to the majority of the other columns in the dataset? Q7. What do you think a zero and one represent for the candy$chocolate column? Q8. Plot a histogram of winpercent values

```
library(ggplot2)
ggplot(candy, aes(winpercent))+ geom_histogram(binwidth = 5)
```



```
hist(candy$winpercent, breaks=15)
```



Q9. Is the distribution of winpercent values symmetrical? No it is not. It is skewed. Q10. Is the center of the distribution above or below 50%? The center is below 50% Q11. On average is chocolate candy higher or lower ranked than fruit candy?

First find all the chocolate candy and their $winpercent values

```
choc<- candy$winpercent[as.logical(candy$chocolate)]

choc
```

```

On average chocolate candy is higher ranked than fruity candy.

Q12. Is this difference statistically significant?

```
t.test(choc, fruity)
```

```

    Welch Two Sample t-test

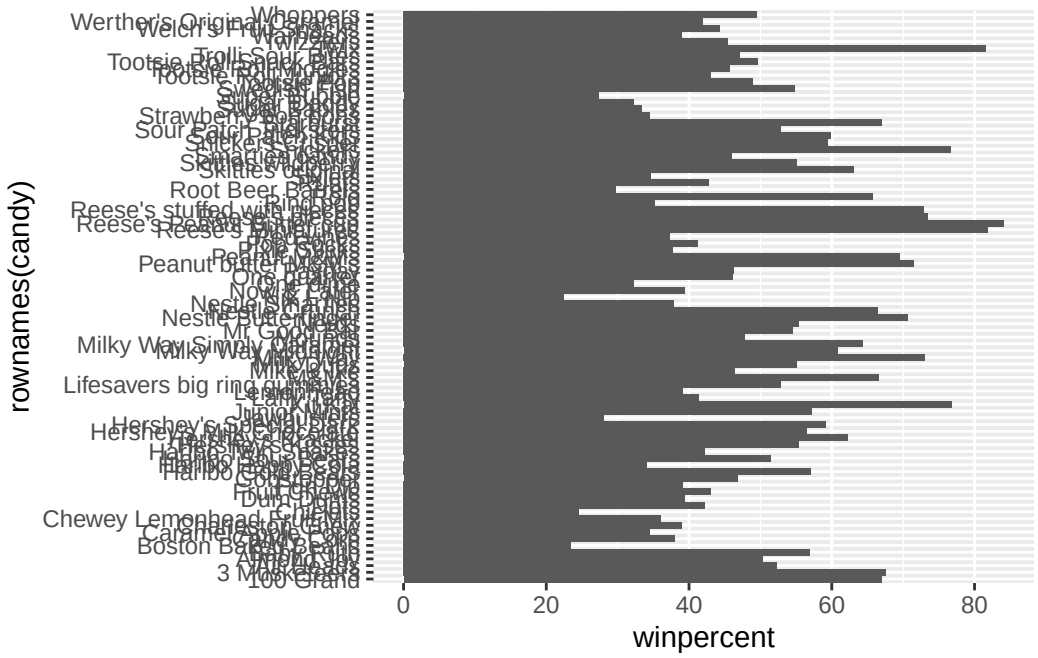
The difference between chocolate and fruity candy is significant.

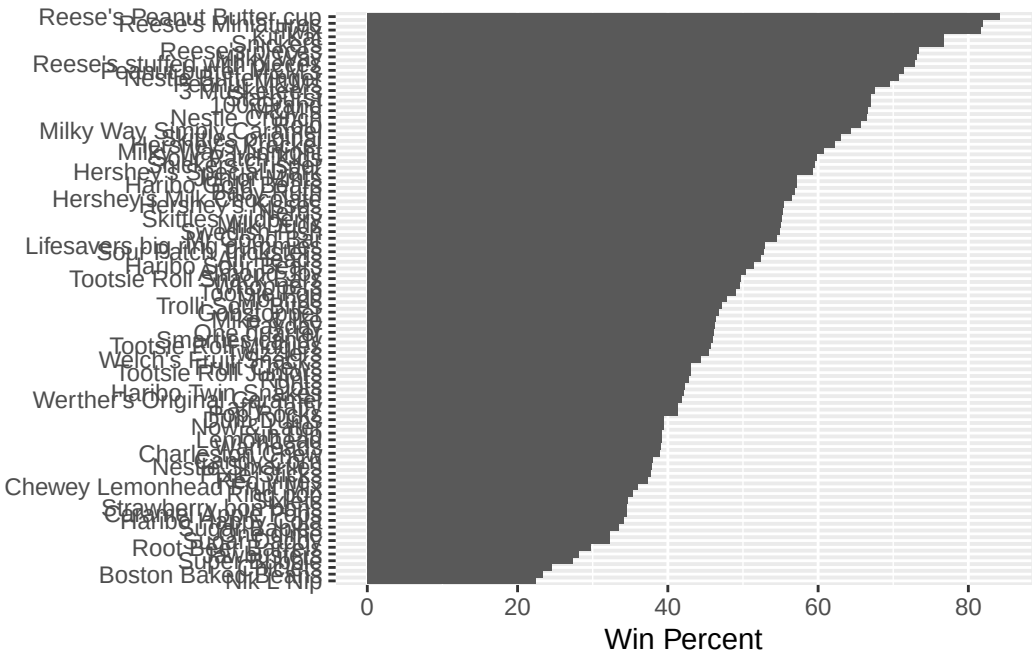
Q13. What are the five least liked candy types in this set? Q14. What are the top 5 all time favorite candy types out of this set?

```
library(ggplot2)
ggplot(candy)+
  aes(winpercent, rownames(candy))+
  geom_col()
```

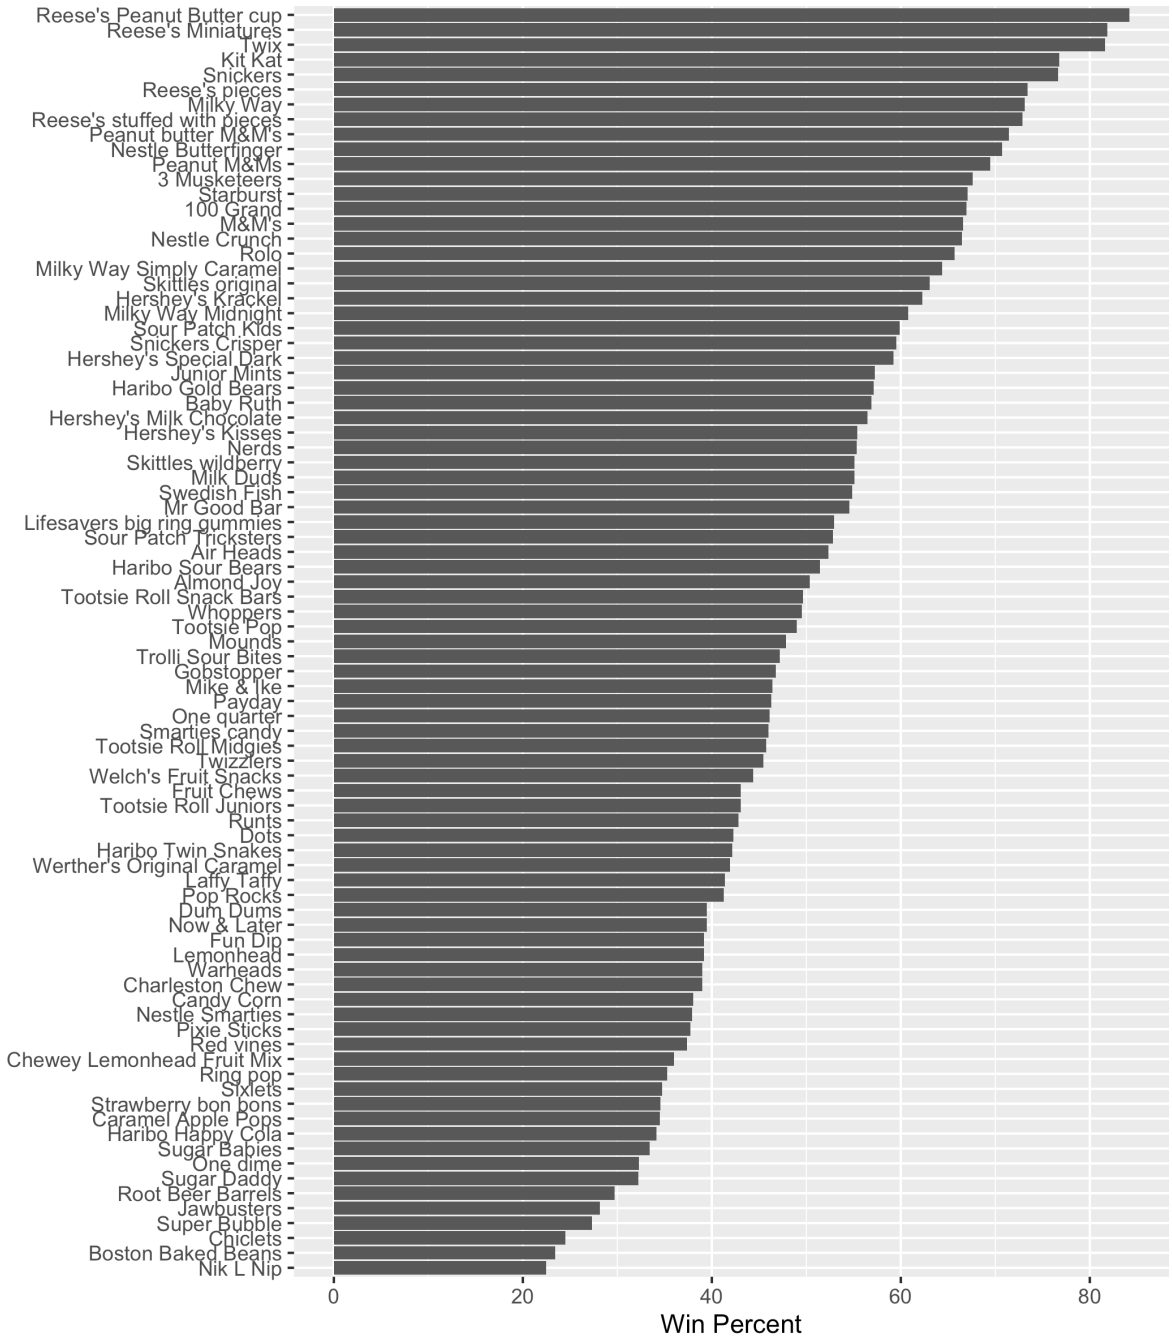


Q16. This is quite ugly, use the reorder() function to get the bars sorted by winpercent?

```
library(ggplot2)
ggplot(candy)+
  aes(winpercent, reorder(rownames(candy), winpercent))+
  geom_col() + labs(y=NULL, x= "Win Percent")
```



```
ggsave('barplot1.png',width=7, height=8)
```



You can insert any image using this markdown syntax

Add some color to our ggplot. We need to make a sutom color vector

```
#start with all black colors
my_cols=rep("black", nrow(candy))
my_cols[as.logical(candy$chocolate)] = "chocolate"
my_cols[as.logical(candy$bar)] = "brown"
my_cols[as.logical(candy$fruity)] = "pink"

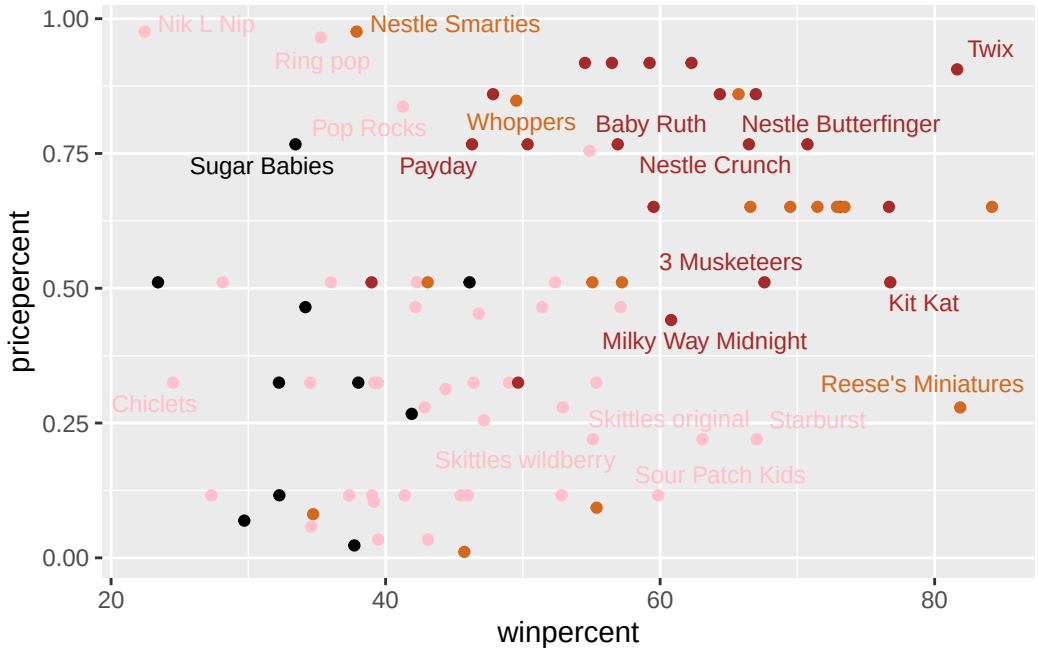
If we want to see what is good candy to buy in terms of winpercent and pricepercent we can plot these two variable and then see the best candy foor the least amount of money

```
library(ggplot2)
library(ggrepel)

# How about a plot of price vs win
```

```
ggplot(candy) +
  aes(winpercent, pricepercent, label=rownames(candy)) +
  geom_point(col=my_cols) +
  geom_text_repel(col=my_cols, size=3.3, max.overlaps = 5)
```

```
Warning: ggrepel: 65 unlabeled data points (too many overlaps). Consider
increasing max.overlaps
```



```
  geom_text_repel(col=my_cols, size=3.3, max.overlaps = 5)

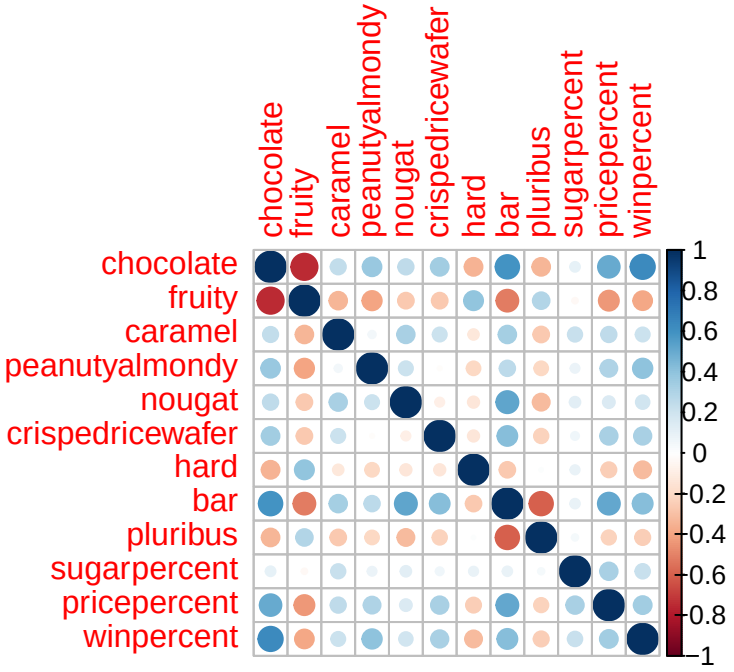
5. Explorng the Correlation Structure

```
library(corrplot)
```

```
corrplot 0.92 loaded
```

```
cij<-cor(candy)
corrplot(cij)
```



Q22. Examining this plot what two variables are anti-correlated (i.e. have minus values)? Q23. Similarly, what two variables are most positively correlated?

On to PCA

The main function for this is called 'prcom'

```
pca <- prcomp(candy, scale=T)
summary(pca)

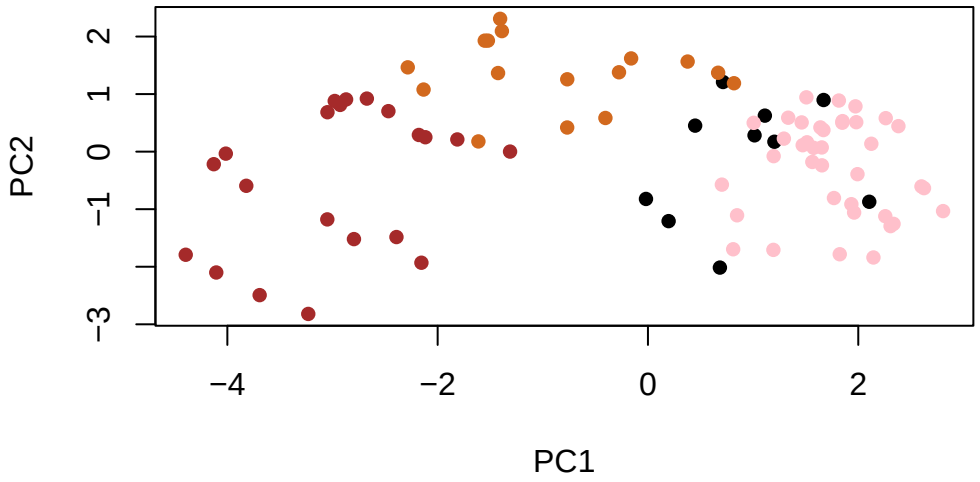
Plot my main PCA score with ggplot

```
my_data <- cbind(candy, pca$x[,1:3])
plot(pca$x[,1:2], col=my_cols, pch=16)
```



```
p<-ggplot(my_data) +
        aes(x=PC1, y=PC2,
